Currently, axillary surgery is necessary for most women with breast cancer. There is no method to detect axillary metastases as effectively as axillary operation. Sentinel lymph node biopsy remains the cornerstone of axillary

management. It can only be omitted in a small number of selected patients. It is not outmoded or obsolete, and cannot be discarded (<https://doi.org/10.1245/s10434-022-12605-x>).
