Three-dimensional modeling of Eagle syndrome

A 63-year-old man presented with transient episodes of left-hand weakness and right-eye vision loss following a lengthy airplane trip. The patient had reported right neck pain after sleeping awkwardly on the flight. Carotid dissection, paradoxical embolism, atherosclerotic occlusion, and thrombotic occlusion were considered possible etiologies of the associated carotid occlusion. Following a period of anticoagulation, a subsequent CT angiography (figure 1, A–C) revealed findings consistent with the styloid-carotid artery, or Eagle, syndrome. A 3-dimensional model was subsequently created (figure 2, A and B) utilizing a 3D printer, which provided the most versatile, safe, and cost-efficient option to visualize the patient’s unique anatomy and plan for surgical intervention.

Figure 1 CT angiography of styloid-carotid artery syndrome

Coronal (A), axial (B), and sagittal (C) maximum intensity projection shows the elongated right styloid process (arrows, A–C) along with the tortuous right internal carotid artery (arrowheads, B and C).

Figure 2 Three-dimensional model of Eagle syndrome

This flexible 3-dimensional model (A and B), created from CT angiography data, allowed for unrestricted manipulation of the patient’s skull and experimentation with various head and neck positions to evaluate the interaction between the elongated styloid process (white arrows, A and B) and right internal carotid artery (black arrows, A and B). This precluded the need for additional angiography.

Subspecialty Alerts by E-mail!

Customize your online journal experience by signing up for e-mail alerts related to your subspecialty or area of interest. Access this free service by visiting Neurology.org/site/subscriptions/etoc.xhtml or click on the “E-mail Alerts” link on the home page. An extensive list of subspecialties, methods, and study design choices will be available for you to choose from—allowing you priority alerts to cutting-edge research in your field!

Applications Now Open for 2017 Diversity in Leadership Program

Applications are now open for the prestigious 2017 AAN Diversity in Leadership Program, which seeks to identify, orient, and cultivate high-potential members from diverse and underrepresented ethnic backgrounds who will be lifetime, engaged contributors to the American Academy of Neurology. View qualifications and apply before the December 10 deadline at AAN.com/view/DiversityLeadershipProgram.

WriteClick® rapid online correspondence

Have a comment on a recent Neurology® article you would like to share? Now it is easier and more convenient. Neurology.org has launched WriteClick on the home page and sidebars of each article to encourage remarks and debate among users.

WriteClick is restricted to comments about studies published in Neurology within the last eight weeks.
